7.3	Takeaway	16

1 Big picture

- **Question.** What does female representation look like in the academic finance profession, and where exactly do gender gaps show up once we control for research productivity and career stage?
- **Setting.** The paper builds a new dataset on **finance faculty at top-100 U.S. business schools** over **2009–2017** and studies outcomes such as institution rank, tenure, promotion to full professor, publications, coauthor networks, exits, and salary.
- **Core challenge.** Raw gender differences are hard to interpret because women in finance are, on average, **younger cohorts** with fewer years since PhD, and career outcomes depend heavily on publications, citations, and school characteristics.
- **Main contribution.** The paper provides the first large-sample, profession-wide evidence for academic finance. It is primarily **descriptive**, but it carefully constructs faculty-level panel data, cleans finance-field classifications, and compares men and women after controlling for research output, cohort, and institution.
- **Why it matters.** Finance is a particularly male-dominated field. Because academic finance shapes MBA teaching, doctoral training, and the finance industry pipeline, persistent gender imbalances may matter both for the profession itself and for broader labor market outcomes.
- **Main empirical findings.**
 - Only about **16%** of finance faculty at top-100 U.S. business schools are women during 2009–2017.
 - After controlling for research productivity, women tend to be employed at **lower-ranked schools** during much of the sample.
 - Women are **less likely to be full professors**; the gap at the top of the ladder is persistent.
 - Women publish **fewer papers**, but the gap is mainly in **lower-tier coauthored work**, not in top-journal output.
 - Conditional on publishing, women appear to write work of at least comparable quality; citation evidence suggests **higher quality conditional on output**.
 - Women have **smaller coauthor networks**, are more likely to coauthor with other women, and are less likely to have coauthors from their own PhD cohorts.
 - Time-series evidence suggests that gaps in **placement, tenure, and salary shrink** over the sample, but the publication gap remains and the full-professor gap is more persistent.
- **Economic takeaway.** The underrepresentation of women in academic finance is not only a “pipeline” issue at entry. Even conditional on observed research productivity, women face weaker career outcomes along important margins, especially near the top of the profession.

2 Data and measurement (key objects)

2.1 School sample and faculty roster construction

- **School universe.** The paper starts from the *U.S. News & World Report* annual ranking of U.S. business schools and defines a **top-100 school** as any school that appears in the top 100 at any

point from 2009 to 2017.

- **Coverage.** A school enters the sample if it is covered in **Academic Analytics (AcA)** for at least one year in the sample period. This leaves **97 schools**.
- **Faculty roster source.** AcA provides yearly business-school rosters with names, titles, employing institutions, PhD institutions, and PhD years. The paper restricts attention to **ladder faculty**: assistant professor, associate professor, and professor.
- **Initial classification problem.** AcA subfield labels are noisy. Some finance scholars are misclassified outside finance, and some nonfinance scholars are mislabeled as finance.
- **Manual refinement.** The authors manually refine the finance faculty list using publication records, CVs, school websites, and LinkedIn pages. They identify **2,011** unique finance faculty at some point in the sample and, after hand-checking gender, work with **2,009** unique faculty in the analysis.

2.2 Publication and citation measures

- **Publication source.** Publication and citation data come from **Scopus author IDs** matched to faculty.
- **Total publications.** All business and economics publications in Scopus.
- **Top publications.** Papers in the **top-3 finance journals** (*Journal of Finance*, *Journal of Financial Economics*, *Review of Financial Studies*) and the **top-5 economics journals** (*American Economic Review*, *Econometrica*, *Journal of Political Economy*, *Review of Economic Studies*, *Quarterly Journal of Economics*).
- **Publication decomposition.** The paper splits publications into:
 - top vs. non-top,
 - solo-authored vs. coauthored.
- **Citations.** Citations are measured through year t and typically enter regressions as $\ln(\text{citations} + 1)$.

2.3 Career outcomes

- **Institution rank.** Mean *U.S. News* ranking during each year. Lower values mean a better-ranked school.
- **Alternative research ranking.** The paper also constructs an alternative rank based on the institution's mean top-publication output.
- **Tenure.** AcA tenure flags are refined manually for schools where associate professors may be tenured or untenured. The authors inspect faculty handbooks, CVs, and earlier data from related work.
- **Full professor status.** Inferred from the title **Professor**.
- **Exit.** Exits are traced manually using CVs, LinkedIn, and archived websites. The paper distinguishes exits to government, the private sector, or nonladder positions.

2.4 Coauthor-network and salary measures

- **Coauthor network variables.** The paper counts unique coauthors through year t , including:
 - all coauthors,
 - top-100 coauthors,
 - female top-100 coauthors,
 - same-cohort coauthors,
 - same PhD-and-cohort coauthors,
 - same-institution coauthors.
- **Salary sample.** Salary data are collected from **37 of the 60 public institutions** in the sample using Freedom of Information Act requests. The main salary analysis uses **3,614 faculty-year observations** with nonmissing nine-month salary data.

2.5 Key descriptive facts

- Women make up **16.0%** of unique faculty in the full sample, **14.3%** at top-30 schools, and **13.1%** at top-10 schools.
- Female representation rises only slowly, from **14.9% in 2009** to **16.8% in 2017**.
- Among faculty with tenure in every year of the sample, only **9.7%** are women.
- Among recent graduates (PhD years 2009–2017), women make up **20.4%**.
- Among faculty obtaining tenure during 2009–2017, **24.3%** are women.
- Women are newer to the profession: the mean years since PhD is about **18.5** for men and **12.1** for women.

3 Models and empirical specifications (all equations + interpretation)

3.1 General empirical strategy

- The paper is **descriptive**, not a structural or causal design.
- It uses two complementary empirical approaches:
 1. **year-by-year cross-sectional regressions** over the full population of finance faculty in each sample year;
 2. **career-horizon regressions** that ask whether a faculty member has a given outcome exactly X years post-PhD.
- The key idea is to compare women and men after conditioning on observable productivity, seniority, and institution.

3.2 Institution-rank regressions

A baseline year-by-year regression takes the form

$$\text{InstitutionRank}_{it} = \beta_t \cdot \text{Female}_i + \gamma_1 \text{Tenured}_{it} + \gamma_2 \ln(\text{Citations}_{it} + 1) \\ + \gamma_3 \ln(\text{TopPubs}_{it} + 1) + \gamma_4 \ln(\text{OtherPubs}_{it} + 1) + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it}.$$

- **Dependent variable.** School rank; lower values mean better placement.
- **Interpretation.** A positive coefficient on **Female** means that women, conditional on publications and citations, are employed at lower-ranked schools.

For the career-horizon version, the regression becomes

$$\text{InstitutionRank}_i(X) = \beta_X \cdot \text{Female}_i + \Gamma'_X Z_i \\ + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_i,$$

where $X \in \{1, 4, 8, 12, 16\}$ years post-PhD.

- **Interpretation.** This asks whether women and men are placed differently at comparable career ages, rather than just in pooled faculty-year data.

3.3 Tenure regressions

For the full-sample year-by-year analysis, the paper estimates a linear probability model:

$$\Pr(\text{Tenured}_{it} = 1) = \beta_t \cdot \text{Female}_i + \gamma_1 \ln(\text{Citations}_{it} + 1) \\ + \gamma_2 \ln(\text{TopPubs}_{it} + 1) + \gamma_3 \ln(\text{OtherPubs}_{it} + 1) + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it}.$$

For the career-horizon exercise,

$$\Pr(\text{Tenured}_i(X) = 1) = \beta_X \cdot \text{Female}_i + \Gamma'_X Z_i \\ + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_i,$$

with $X \in \{6, 8, 10, 12\}$ years post-PhD.

- **Extended specification.** Following Sarsons et al. (2021), the paper also replaces aggregate publication measures with top/non-top and solo/coauthored publication categories, interacted with gender.
- **Interpretation.** The tenure regressions ask whether, after controlling for research output and cohort, women lag men in receiving tenure.

3.4 Full-professor regressions

The paper uses analogous linear probability models for promotion to full professor:

$$\Pr(\text{FullProf}_{it} = 1) = \beta_t \cdot \text{Female}_i + \gamma_1 \ln(\text{Citations}_{it} + 1) \\ + \gamma_2 \ln(\text{TopPubs}_{it} + 1) + \gamma_3 \ln(\text{OtherPubs}_{it} + 1) + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it},$$

for the year-by-year specification, and

$$\begin{aligned}\Pr(\text{FullProf}_i(X) = 1) = & \beta_X \cdot \text{Female}_i + \Gamma'_X Z_i \\ & + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_i,\end{aligned}$$

for $X \in \{10, 12, 14, 16, 18, 20\}$ years post-PhD.

- **Interpretation.** These regressions isolate the gender gap at the top of the academic ladder.

3.5 Exit regressions

The exit specification is

$$\begin{aligned}\Pr(\text{Exit}_i(X) = 1) = & \beta_X \cdot \text{Female}_i + \gamma_1 \ln(\text{Citations}_{it} + 1) \\ & + \gamma_2 \ln(\text{TopPubs}_{it} + 1) + \gamma_3 \ln(\text{OtherPubs}_{it} + 1) + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_i,\end{aligned}$$

where exit means moving to government, the private sector, or a nonladder position.

- **Interpretation.** This helps distinguish between slower advancement and early attrition as possible explanations for tenure and promotion gaps.

3.6 Publication regressions

The main research-output regression is

$$\begin{aligned}\ln(\text{TotalPubs}_{it} + 1) = & \beta \cdot \text{Female}_i + \gamma_1 \text{Tenured}_{it} + \gamma_2 \text{YearsSincePhD}_{it} \\ & + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it}.\end{aligned}$$

The same regression is then estimated separately for:

- top publications,
- other publications,
- top solo-authored publications,
- other solo-authored publications,
- top coauthored publications,
- other coauthored publications.
- **Interpretation.** These regressions separate a **quantity gap** from a **quality gap**. If women publish fewer papers overall but not fewer top papers, the problem is quantity rather than top-journal quality.

3.7 Coauthor-network regressions

The coauthor regressions take the form

$$\begin{aligned}\ln(\text{Coauthors}_{it} + 1) = & \beta \cdot \text{Female}_i + \gamma_1 \text{Tenured}_{it} + \gamma_2 \text{YearsSincePhD}_{it} \\ & + \gamma_3 \ln(\text{Citations}_{it} + 1) + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it},\end{aligned}$$

with extended versions adding publication controls.

- **Interpretation.** These regressions test whether women differ from men in the size and composition of successful coauthor networks.

3.8 Salary regressions

The salary specification is

$$\begin{aligned}\ln(\text{Salary}_{it}) = & \beta \cdot \text{Female}_i + \gamma_1 \text{Tenured}_{it} + \gamma_2 \text{YearsSincePhD}_{it} \\ & + \gamma_3 \ln(\text{Citations}_{it} + 1) + \gamma_4 \ln(\text{TopPubs}_{it} + 1) + \gamma_5 \ln(\text{OtherPubs}_{it} + 1) \\ & + \phi_{\text{PhD year}} + \psi_{\text{institution}} + \varepsilon_{it}.\end{aligned}$$

- **Interpretation.** The preferred salary specification compares faculty **within the same institution** after accounting for seniority and observed productivity.

4 Identification and instruments (what makes the estimates credible)

4.1 What the paper is and is not identifying

- This is **not** a causal paper in the sense of using an exogenous policy shock, instrument, or natural experiment.
- The regressions identify **conditional gender differences**, not structural discrimination parameters.
- The authors explicitly note survivorship concerns and the fact that they observe only faculty who hold jobs at top-100 U.S. business schools at some point during the sample.

4.2 Why the descriptive comparisons are still informative

- **Rich controls for productivity.** The paper conditions on citations and publications, and often separates top from non-top publications.
- **PhD-year fixed effects.** These absorb cohort differences, which is critical because women are disproportionately from more recent cohorts.
- **Institution fixed effects.** These allow within-school comparisons in many specifications.
- **Career-horizon design.** Looking at outcomes exactly X years post-PhD reduces life-cycle composition problems relative to raw pooled comparisons.
- **Manual data cleaning.** The authors hand-check finance classifications, gender, tenure year, title changes, exits, and salary data.

4.3 Main limitations

- The paper cannot observe the full **pipeline**: applications to PhD programs, admissions, completion, first placements outside top-100 schools, and complete careers.

- Publication records may understate true productivity if women perform more teaching, service, mentoring, or other nonpublication work.
- Differences in placement or promotion may reflect discrimination, family constraints, partner-location issues, preferences, networks, or other unobserved factors; the paper does not separate these mechanisms.

4.4 Economic interpretation of the identification strategy

- The paper asks a narrow but powerful question: *among people observed in the profession, and conditioning on what can be measured about research output and career stage, do women and men look similar?*
- The answer is often **no**, especially for placement and promotion to full professor.

5 Tables and figures

5.1 Figure 1, Figure 2, Figure 3, and Table II: representation and cohort composition

Figure 1. Sample of finance faculty by year. This figure shows the number of faculty and the percentage of faculty who are female by year. (Color figure can be viewed at wileyonlinelibrary.com)

Figure 2. Sample of tenured finance faculty by year. This figure shows the number of tenured faculty and the percentage of tenured faculty who are female by year. (Color figure can be viewed at wileyonlinelibrary.com)

Figure 3. Faculty graduating with a PhD in 2009 and thereafter. This figure shows the number of faculty graduating with a PhD in 2009 to 2017 ("recent graduates") and the percentage of recent graduates who are female by year. (Color figure can be viewed at wileyonlinelibrary.com)

- **Figure 1.** Female representation in finance faculty rises only slowly, from **14.9% in 2009** to **16.8% in 2017**.
- **Figure 2.** Female representation among tenured faculty rises faster, from about **10%** to **14.8%**, but still remains low.
- **Figure 3.** Among recent PhD graduates, female representation is around **20%** and does not appear sharply worse at top programs, although women come from a more dispersed set of graduate schools.
- **Table II.** Women are less represented at top schools: **14.3%** at top-30 schools and **13.1%** at top-10 schools. Public institutions employ a somewhat larger female share than private institutions.
- **Read.** The basic problem is visible before any regression: finance is highly male, especially at the top.

5.2 Table III: publication records

- The average woman in the sample has about **51%** as many total publications as the average man (7.24 vs. 14.33).

Table II
Summary Statistics

This table reports the number of unique faculty members in the sample. *All Institutions* is the full sample of business schools, defined as any school that appears in the *U.S. News & World Report's* list of top-100 U.S. business schools list at least once during the 2009 to 2017 sample period and also covered in the Academic Analytics database at least once in the sample period. "Recent Graduates" are those faculty who completed their PhDs during the 2009 to 2017 sample period. *Top30* is the subsample of schools with a *U.S. News & World Report* ranking of 30 or better at any point over the sample period. *Top10* is the subsample of schools with a rank of 1 to 10 in *U.S. News & World Report* at least once over the sample period. *Publication Tier 1* is based on the alternative ranking variable and indicates those institutions in the first quartile of research productivity, measured as the average number of top publications by faculty employed by the institution. *Public* and *Private* indicate public and private institutions, respectively. *%Female* is the fraction of faculty-year observations in which the faculty member is female.

	All Institutions		Top 30		Top 10	
	Total	%Female	Total	%Female	Total	%Female

Table III
Faculty Publications

This table reports the mean number of publications by faculty members in the sample. *Total Publications* comprises all publications in the business and economics category, as defined by Scopus. *Top Publications* comprises all publications in the top-3 finance and top-5 economics journals. The top-3 finance journals are *The Journal of Finance*, *Journal of Financial Economics*, and *Review of Financial Studies*. The top-5 economics journals are *American Economic Review*, *Econometrica*, *Journal of Political Economy*, *Review of Economic Studies*, and *Quarterly Journal of Economics*. Table II defines “All,” “Top 30,” “Top 10,” “Pub. Tier 1,” “Public,” and “Private” institution categories. “At Tenure Year” includes those faculty who obtain tenure during the 2009 to 2017 period and shows the publication record as of the year in which the faculty member receives tenure. “At Promotion to Full Year” includes those faculty who are promoted to full professor during the 2009 to 2017 period and shows the publication record as of the year in which the faculty member is promoted to full professor. “Recent graduates” are those faculty who completed their PhDs during the 2009 to 2017 sample period

Other Solo-Authored Publications						
All Faculty	3.81	1.38	1.81	0.85	3.05	1.23
Untenured Faculty	0.56	0.44	0.35	0.39	0.46	0.27
Tenured Faculty	5.14	2.10	2.39	1.18	4.05	2.20
At Tenure Year	1.54	1.19	1.11	1.10	1.36	0.87
At Promotion to Full Year	1.95	1.40	1.59	1.19	1.71	1.67
Recent Graduates	0.28	0.22	0.21	0.19	0.31	0.13

- The raw gap is much smaller for **top publications** than for lower-tier journals.
- **Read.** Raw publication differences are large, but they do not automatically imply lower top-journal quality.

5.3 Table IV, Table V, and Figure 4: institution rank

Table IV
After Controlling for Research Productivity Are Female Faculty More Likely to Be Employed by Lower Ranked Institutions?

This table reports results of OLS regressions in which the dependent variable is *Institution Rank*, defined as the mean U.S. News & World Report ranking over the 2009 to 2017 sample period. Lower values of *Institution Rank* are associated with higher school ranking (i.e., a value of one ranks to the highest ranked school). The explanatory variables are *Female*, a dummy equal to 1 if the faculty member is female; *Tenured*, a dummy equal to 1 if the faculty member has tenure during year *t*; *Citations*, defined as $\ln(\text{number of citations} + 1)$, where the number of citations is calculated through year *t*; *Top Pubs*, defined as $\ln(\text{number of top publications} + 1)$, where the number of top publications is the total number of top-3 finance and top-5 economics publications through year *t*; and *Other Pubs*, defined as $\ln(\text{number of other publications} + 1)$, where the number of other publications is defined as publications through year *t* in all outlets that are not top publications. Citations (1) through (6) show results from year-by-year regressions. We also include PWD year fixed effects in the specification. % Female Faculty is the percentage of women of all faculty-year observations. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

Table V
Are Female Faculty More Likely to Be Employed by Lower Ranked Institutions 1, 4, 8, 12, and 16 Years Post-PhD?

This table reports results from estimating a linear probability model in which the dependent variable is *Institution Rank*, *X* years post-PHD. *Institution rank* is defined as the mean U.S. News & World Report ranking over the 2009 to 2017 sample period. *X* years post-PHD is measured at *X* = 1, 4, 8, 12, and 16. Explanatory variables are *Female*, a dummy equal to 1 if the faculty member is female; *Tenured*, a dummy equal to 1 if the faculty member is tenured (outcomes (2) through (5) only); *Citations*, defined as $\ln(\text{number of citations} + 1)$, where the number of citations is calculated through year *t*; *Top Pubs*, defined as $\ln(\text{number of top publications} + 1)$, where the number of top publications is the total number of top-3 finance and top-5 economics publications through year *t*; and *Other Pubs*, defined as $\ln(\text{number of other publications} + 1)$, where the number of other publications is defined as publications through year *t* in all outlets that are not top publications. % Female Faculty is the percentage of women of all faculty-year observations. * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$.

PWD Year FE	Yes	Yes	Yes	Yes	Yes

Figure 4. Are female faculty more likely to be employed by lower ranked schools? The figure shows the point estimates and 95% confidence intervals around the coefficients on the *Female* dummy for each year in the Table IV regressions. The figure also plots the difference between the estimated coefficient on the *Female* dummy in year *t* and the estimated coefficient in 2009. (Color figure can be viewed at wileyonlinelibrary.com)

- **Table IV / Figure 4.** After controlling for productivity, women are employed at lower-ranked schools during the early and middle parts of the sample. In 2009 the estimated gap is about **6.4 ranks**; by 2017 the coefficient is about **0.8** and statistically insignificant.
- **Table V.** At exact career horizons, women are still at lower-ranked institutions at **4, 8, 12, and**

Read. The placement gap is real, but it appears to be shrinking for more recent cohorts.

- **Table VIII / Figure 6.** In contrast to tenure, the gap in full-professor status is present in **every year** of the sample. The magnitude declines somewhat, but the decline is not statistically significant.
- **Table IX.** By exact career horizons, women are significantly less likely to be full professor at longer horizons: about **13.1%** lower at year 16, **21.3%** lower at year 18, and **20.2%** lower at year 20 post-PhD.
- **Read.** The most persistent gender gap is at the **very top of the ladder**. This is the paper's strongest evidence that the problem is not only an entry issue.

Table VII
Are Female Faculty Equally Likely to Be Full Professors?

This table reports results from a linear probability model in which the dependent variable is a dummy variable equal to 1 if the faculty member is a full professor during year t . The sample includes assistant professors. The explanatory variables are: *Female*, a dummy equal to 1 if the faculty member is female; *Search/PostPhD*, the natural log of the number of citations from since the faculty member earned a PhD; *Citations*, defined as $\ln(\text{number of citations} + 1)$, where the number of citations is calculated through year t ; *Top Pubs*, defined as $\ln(\text{number of top publications} + 1)$, where the number of top publications is the total number of top-3 finance and top-5 economics publications through year t ; and *Other Pubs*, defined as $\ln(\text{number of other publications} + 1)$, where the number of other publications is the number of other publications defined as publications through year t in all outlets that are not top publications. PhD Year and institution fixed effects are included in the specification. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Table IX
Are Female Faculty Equally Likely to Be Full Professors 10, 12, 14, 16, 18, and 20 Years Post-PhD?

This table reports results from estimating a linear probability model in which the dependent variable is a dummy variable equal to 1 if the faculty member is a full professor X years post-PhD, where $X = 10, 12, 14, 16, 18$, and 20. Explanatory variables are: *Female*, a dummy equal to 1 if the faculty member is female; *Citations*, defined as $\ln(\text{number of citations} + 1)$, where the number of citations is calculated through year t ; *Top Pubs*, defined as $\ln(\text{number of top publications} + 1)$, where the number of top publications is the total number of top-3 finance and top-5 economics publications through year t ; and *Other Pubs*, defined as $\ln(\text{number of other publications} + 1)$, where the number of other publications is defined as publications through year t in all outlets that are not top publications. All specifications include institution and PhD year fixed effects and standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Figure 6. Are female faculty equally likely to be full professors? Year-by-year analysis. The figure shows the point estimates and 95% confidence intervals around the coefficients on the *Female* dummy for each year in the Table VII regressions. The figure also plots the difference between the estimated coefficient on the *Female* dummy in year t and the estimated coefficient in 2008. (Color figure can be viewed at wileyonlinelibrary.com)

Table X
Do Women Exit Early?

This table reports results of a linear probability model in which the dependent variable is a dummy variable equal to 1 if the faculty member exits to the government, the private sector, or a nonladder position by six years post-PhD (for full sample) and by 3, 4, 5, and 6 years post-PhD (for the recent graduates subsample). Recent graduates are faculty with ladder positions at a top-100 school that earned PhDs between 2009 and 2017. Explanatory variables are: *Female*, a dummy equal to 1 if the faculty member is female; *Citations*, defined as $\ln(\text{number of citations} + 1)$, where the number of citations is calculated through year t ; *Top Pubs*, defined as $\ln(\text{number of top publications} + 1)$, where the number of top publications is the total number of top-3 finance and top-5 economics publications through year t ; and *Other Pubs*, defined as $\ln(\text{number of other publications} + 1)$, where the number of other publications is defined as publications through year t in all outlets that are not top publications. Institution and PhD year fixed effects are included in the specification. Standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

5.6 Table X: exits

- The paper finds **no strong evidence** that women exit early to government, the private sector, or nonladder positions at either the six-year horizon in the full sample or the 3–6 year horizons among recent graduates.
- Low **top-journal publication output** is the strongest predictor of exit.
- **Read.** Early attrition does not appear to be the main explanation for the observed gender gaps.

5.7 Table XI, Table XII, and Figure 7: research output

- **Table XI.** In the pooled publication regressions, the coefficient on **Female** is about **−0.190**, implying that women publish roughly **17.3% fewer** papers, conditional on tenure, cohort, and institution.
- For recent graduates, the coefficient is about **−0.123**, implying a smaller but still meaningful gap of about **11.5%**.
- **Figure 7.** The publication gap shows **no clear evidence of shrinking over time**.
- **Table XII.** The publication gap is driven mainly by **other coauthored publications** and, to a lesser extent, **other solo publications**. The paper does **not** find statistically significant

Table XI
Gender Differences in Research Output

This table reports results of panel regressions in which the dependent variable is *Total Publications*, defined as the number of total publications ≥ 1 , where the number of total publications by the faculty member are calculated through year t . The explanatory variables are: *Female*, a dummy equal to 1 if the faculty member is female; *Tenured*, a dummy equal to 1 if the faculty member has tenure during year t ; and *YearsSincePhD*, the natural log of the number of calendar years since the faculty member earned a PhD. Column (1) reports results of a pooled regression without fixed effects. Column (2) is identical to column (1) but includes PhD year fixed effects. Column (3) includes both PhD year and institution fixed effects. Column (4) shows regression results for the subsample of recent graduates (i.e., faculty earning PhDs between 2009 and 2017). PhD year and institution fixed effects are included in the specification. Standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Table XII
Gender Differences in Research Output, by Publication Type

This table reports results of panel regressions that are identical to those in column (3) of Table XI, except *Total Pubs* is decomposed into publication type. Dependent variables are: *Top Pubs*, the total number of top-3 finance and top-5 economics publications through year t ; *Other Pubs*, the publications through year t in all outlets that are not top publications; *Top Coauth Pubs*, the number of coauthored publications in top-3 finance and top-5 economics journals through year t ; *Other Coauth Pubs*, all coauthored publications that are not in top journals; *Top Solo Pubs*, the number of solo-authored publications in top-3 finance and top-5 economics journals through year t ; and *Other Solo Pubs*, all solo-authored publications through year t that are not in top journals. We transform each of the publication variables into $\ln(\text{publication variable} + 1)$. The explanatory variables are: *Female*, a dummy equal to 1 if the faculty member is female; *Tenured*, a dummy equal to 1 if the faculty member has tenure during year t ; and *YearsSincePhD*, the natural log of the number of calendar years since the faculty member earned a PhD. Institution and PhD year fixed are included in the specification. All regressions are pooled and include data for all faculty-years. Standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Figure 7. Are there gender differences in research output? Year-by-year analysis. The figure shows the point estimates and 95% confidence intervals around the coefficients on the *Female* dummy for each year of regressions in which the dependent variable is *Total Publications*, defined as the number of total publications by the faculty member through year t .
The full specification and estimated coefficients are in Table 1A.XVII.
(Color figure can be viewed at wileyonlinelibrary.com)

differences in top-journal output, whether solo or coauthored.

- Additional citation analysis suggests that women are cited at least as much, and often more, conditional on publication counts.
- **Read.** The paper finds a **quantity gap, not a top-quality gap.**

5.8 Table XIII: coauthor networks

Table XIII
Gender Differences in Coauthor Networks

This table reports results of panel regressions in which the dependent variable is the number of unique coauthors through year t , where *All Coauthors* (column (1)) indicates the number of unique coauthors, *Top-100 Coauthors* (column (2)) indicates the number of unique coauthors from the sample of top-100 schools, *Female Top-100 Coauthors* (column (3)) indicates the number of unique female coauthors from top-100 schools, *Same Cohort* (column (4)) indicates the number of unique coauthors through year t from top-100 schools who graduated within four years of the faculty member, *Same PhD and Cohort* (column (5)) indicates the number of unique coauthors from the same PhD program who obtained their PhDs within four years of the faculty member, and *Same Institution* (column (6)) indicates the number of unique coauthors employed by the same institution as the faculty member at some point during years $t-5$ to $t-1$ relative to the publication date. We transform each of the coauthor variables into $\ln(\text{coauthor variable} + 1)$. In Panel A, the explanatory variables are: *Female*, *Tenured*, *YearsSincePhD*, and *Citations*. In Panel B, we add publication variables *Top Pubs* and *Other Pubs* as explanatory variables. These explanatory variables are defined in Table XII. All standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

- Women have **11.8% fewer** coauthors overall and about **7.5% fewer** top-100 coauthors.
- At the same time, women have about **5.9% more** female coauthors.
- Women also have about **7.7% fewer** same-cohort coauthors.
- After controlling for publication output, the overall coauthor-count gap becomes much weaker, but the gender composition difference persists: women publish on teams with **more women**.
- **Read.** Women's networks appear **smaller and differently structured**, which may matter for collaboration opportunities and promotion.

5.9 Table XIV and Figure 8: salary

- Salary data are available only for a public-school subsample.

Table XIV
Is There Evidence of a Gender Wage Gap?

This table reports results of panel regressions in which the dependent variable is the natural log of the faculty member's nine-month salary. The explanatory variables are defined in Table IV. Columns (1) through (3) include only the *Female* dummy and various fixed effects. Columns (4) through (6) include controls. All standard errors are clustered by year and unique faculty identifier. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$

Figure 8. Is there evidence of a gender wage gap? Year-by-year analysis. The figure shows the point estimates and 95% confidence intervals around the coefficients on the *Female* dummy for each year of regressions in which the dependent variable is $\ln(\text{nine-month salary})$. The figure also plots the difference between the estimated coefficient on the *Female* dummy in year t and the estimated coefficient in 2009.
**The full specification and estimated coefficients are in Table IA.XXIV.
(Color figure can be viewed at wileyonlinelibrary.com)

- In the preferred pooled specification comparing faculty within the same institution and controlling for productivity and seniority, the estimated wage gap is about **3.7%**, but it is **not statistically significant** over the full 2009–2017 period.
- **Figure 8.** Year-by-year estimates show that a significant pay gap exists in some early years of the sample, especially around **2011–2012**, but it disappears by about **2015**.
- **Read.** Salary differences look smaller and more transitory than the gaps in placement, publications, or promotion to full professor.

6 Short summary

- **Method.** Descriptive faculty-level panel study of academic finance using AcA rosters, Scopus publications/citations, manual data cleaning, and regressions with cohort and institution controls.
- **Identification.** Conditional comparison of men and women using productivity controls, fixed effects, and exact-career-horizon regressions rather than causal instruments.
- **Application.** Finance faculty at top-100 U.S. business schools, 2009–2017.
- **Main result.** Women are underrepresented in academic finance and, conditional on observed productivity, tend to be at lower-ranked institutions, less likely to be full professors, publish fewer papers, and have smaller coauthor networks. Gaps in placement, tenure, and salary narrow over time, but the publication gap remains and the full-professor gap is the most persistent.

7 Conclusion

7.1 Core conclusion (what the paper establishes)

- The paper establishes a detailed set of facts about gender in academic finance.
- It shows that female underrepresentation in the profession is accompanied by meaningful conditional differences in career outcomes and research output.

- These differences are not uniform across all margins: some are shrinking, while others remain persistent.

7.2 Economic intuition

- If observed gender imbalance were *only* a pipeline problem at entry, then women who do enter academic finance should look similar to men once we condition on research productivity.
- Instead, the paper finds that gaps remain in placement and especially in promotion to full professor, suggesting that later-career progression and professional networks matter in addition to entry.
- At the same time, the fact that women are not underperforming in top-journal output or citations conditional on output suggests that the central issue is not lower research quality.

7.3 Takeaway

The main lesson of the paper is that gender imbalance in academic finance is a **career-dynamics problem as well as a representation problem**. Women are entering the profession in larger numbers, and some gaps are narrowing, but the top of the profession remains disproportionately male, publication quantity remains lower for women, and collaboration networks appear more constrained. Any attempt to understand or improve gender balance in finance needs to think jointly about entry, publishing, networks, promotion, and the long path from assistant professor to full professor.
